The Gulf of Mexico vs. Katrina

Hurricane Katrina was a catastrophic event with a human cost that cannot yet be fully evaluated. It was exactly what analysts at the U.S. Energy Information Administration feared the most - a severe hurricane impacting oil production and refineries at the height of summer driving season when gasoline inventories were low. Heading into Labor Day, inventories were near the bottom end of the average range in absolute terms, but given growth in demand, the gasoline inventory was even tighter. With oil prices already rising, analysts wondered what might happen should a supply shock occur as well.

Unfortunately, we saw what happened. But the extent to which fears are realized will largely depend on how long the petroleum infrastructure remains offline. Oil production platforms, import terminals, pipelines, and refineries were affected by Hurricane Katrina, whose path took it directly over many production facilities in the Gulf of Mexico as well as many refineries in Louisiana and one major refinery in Mississippi. As a result, crude oil prices and petroleum product prices spiked. Unlike Hurricane Ivan, which was a major hurricane that affected oil facilities last September and had a more lasting impact on crude oil production, it appears that Katrina may have a more lasting impact on refinery production and distribution. Thus, while the spot price of WTI crude rose by almost \$4/bbl (abt. 10 cents/gal) between August 26th and 30th, the spot price of gasoline in New York rose by 78 cents. The path product prices take will largely depend on how quickly refineries can get back to normal operation.

There are several factors inhibiting production. First, employees evacuated need to return to work. While some refineries may have skeleton crews, it may be time before authorities let people back into severely impacted areas. As many companies state, safety of employees is of primary concern. Another factor impacting production is supply of crude oil. The Capline, a major crude oil pipeline feeding many Midwest refineries with crude oil from the Gulf of Mexico, was shut down due to lack of electricity at many pumping stations. As a result, one Midwest refinery reduced production due to loss in supply. With the recent decision that crude oil from the Strategic Petroleum Reserve will be made available, there may be relief for refiners that reduced production due to loss of supply - however, they need to find a way to get the oil from the SPR. Another factor impacting operations is loss of electrical power. Refineries are dependent on electricity and in some areas it may take time to get power restored. How quickly power can be restored to affected refineries will be a key factor in determining how quickly they can return to normal. Finally, refiners need to perform

damage assessments to determine what repairs are needed. The extent to which flooding may have caused damage to refineries will be a key barometer that analysts will be waiting to hear.

As time passes, the impact of the given shortfall in supply will be spread over the wider national and international markets, lessening price impacts from those that occur initially in more localized markets. However, it may take weeks for available supplies to move where they are most needed. Increased supplies from unaffected refiners may also offset the loss of total product supply due to refinery outages, but the very high utilization rates of worldwide refining capacity even before Hurricane Katrina struck will tend to limit the size of any absolute supply response. In summary, the impact Hurricane Katrina will ultimately have on oil markets will depend on how quickly petroleum facilities, particularly refineries, will be able to recover. How high product prices reach and how long they stay at elevated levels will largely be determined by how quickly refinery capacity can be restored.

According to the International Energy Agency of Paris, all 26 IEA member countries will take collective action in response to the interrupted oil supplies caused by Hurricane Katrina. IEA countries plus the EU Commission unanimously supported making available the equivalent of 2 million b/d of oil for an initial period of 30 days. IEA consulted with major producers and OPEC who also committed to make incremental oil available. Although the initial impact of the storm was regional, implications for the oil market are global.

With 90 offshore rigs drilling for natural gas and 12 for oil, probably of equal importance in the Gulf of Mexico is the price of U.S. natural gas. Reflecting early storm preparations, the

(Continued on page 12)

(Continued from page 11)

EIA reported U.S. inventories of propane inched lower to an estimated 65.4 million barrels before Katrina. Although modest, this dip in inventories may be the start of a period of inventory volatility that may last for some time as the petroleum industry slowly repairs damaged infrastructure. According to the EIA, natural gas spot and futures prices increased sharply as Hurricane Katrina's movement through the Gulf of Mexico brought widespread evacuations of facilities and an unknown amount of infrastructure damage. Katrina's destructive path through has taken a major portion of production in the Gulf off-line, causing prices to increase. Prices that were already elevated relative to historical norms moved even higher. Price shocks from the loss of supplies rippled throughout the country. In the Northeast, the average price increase on the week was \$3.46/MMBtu. The price at the Transcontinental Gas Pipeline in the Mid-Atlantic region rose \$4.54/MMBtu to \$14.88, highest in the Northeast.

There is still considerable uncertainty as to the extent of damage and ultimate amount of lost production. As of August 31, there were still 482 platforms and 79 rigs evacuated, down from 645 platforms and 90 rigs the day before. RigLogix reported 12 out of 62 rigs in Gulf of Mexico block areas directly in the path of the hurricane were damaged along with a 30 platforms. 7 additional BP platforms and one El Paso platform were lost completely. As of the September 2nd Baker Hughes Rig Count for offshore Gulf of Mexico, there were 92 rigs compared to 96 the previous week. Subsequent though to cutoff for the following week's count, they confirmed the loss or significant damage of additional rigs which will be reflected in the next count. Several companies such as Dominion and ExxonMobil said inspections from flyovers indicated only minor damage. Shell reported significant topside damage to its Mars tension leg platform, which produces both oil and natural gas. However, a full assessment will not be available until a more thorough inspection is complete. Katrina may have damaged key natural gas processing facilities, which could delay a recovery of gas supplies. Even if platforms and pipelines are either unaffected or readily restored to service, gas generally cannot flow to market without treatment. Four plants may have been affected that have a combined capacity of 5.5 Bcf/d, which is equivalent to slightly more than 10% total national production.

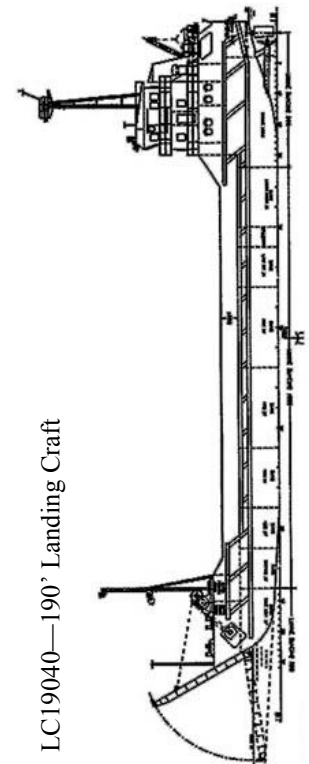

Communications with most OSV operators is difficult with much of the surrounding area currently without electrical power, Internet connectivity and telecommunications. Many companies temporarily moved their headquarters further west to undamaged areas such as Houston and other cities. One operator we are in daily contact with is trying to work out of a relative's house a hundred miles inland with everyone fighting over the cell phone.

A number major OSV operators, so far, reported little vessel damage, but most are still "up past their hip boots in alligators" and too busy working to report. We expect to hear about further damage in the next few weeks. While trying to arrange "spot" charters in the area, Marcon generally has been advised that all "available" boats are working as drillers assess damage and get facilities back to work. Construction vessels and barges are likely to be busy through 2006, but look out for a possible decline in employment for PSV's if offshore facilities are not promptly put back to work or more rigs moved out of the Gulf.
